AUTHORS: Popeleva, G.S., Savushkina, V.I., Andrianov, K.A. and
Golubtsov, S.A.TITLE: Interaction of the halogen derivatives of aryl chlorosilanes
with hydrogen chlorosilanes

PERIODICAL: Zhurnal obshchey khimii, v.32, no. 2, 1962, 557-562

TEXT: High temperature condensations of methyl dichlorosilane (I) with methyl chlorophenyl dichlorosilane (II) (reaction 1), methyl phenyl chlorosilane (III) with p-dichlorobenzene (reaction 2) and of III with methyl chlorophenyl phenyl chlorosilane (IV) (reaction 3) were investigated. Reaction 1 was carried out with 1:11 molar ratios of the reagents at 570, 600, 620, 640 and 670°C, with contact times of 40, 50, 60 and 80 sec., in stainless steel tubes and yielded a mixture of the ortho-, meta- and para-isomers of bis (methyl dichlorosilyl) benzene (A). It was found that the yield of A, under optimum conditions (640°C, 60 sec.), was 27%, calculated with respect to I. The product then consisted of 60% of the liquid meta-isomer and 40% of the crystalline ortho- and para-isomers. Reaction 2 at Card 1/2

Interaction of the halogen ...

550°C, with a contact time of 40 sec., in silica tubes, gave IV in 34.6% yield, (calculated with respect to III), when the molar ratio of III to the p-dichlorobenzene was 2:1. Reaction 3 was carried out in silica tubes, at 650°C and with 40 sec. contact time, with reagents in 1:1 molar ratio, and gave para-bis (methyl phenyl chlorosilyl) benzene (B), in ~ 30% yield (calculated with respect to III). The structure of B was confirmed by a Grignard synthesis. Physical constants of the products and full experimental details are given. There are 2 figures, 4 tables and 15 references: 9 Soviet-bloc and 6 non-Soviet-bloc. The 4 most recent references to the English-language references read as follows: British Pat. 752,700 (1956); Ch.A., 51, 7402, (1957); Ch.A. 47, 3875, (1953); Ch.A. 47, 3334, (1953).

TITLE: Study of vinyl chlorosilane synthesis

SOURCE: Khimiya i prakticheskoye primeneniye kremneorganicheskikh soyedineniy; trudy konferentsii, no. 6, Doklady, diskussii resheniye. II Vses. Konfer. po khimii i prakt. prim. kremneorg. soyed., Len. 1958. Leningrad. Izd-vo AN SSSR. 1961, 90-94

TEXT: During the investigation of the reaction $3\text{CH}_2 = \text{CHCl} + \text{Si}\text{CH}_2 = \text{CHSiCl}_3$ it was found that the catalyst prepared from precipitated CuO, Si powder and a liquid glass binder was the most active. 3 methods of contacting were tried: (1) Stationary bed of pelletized catalyst (2 - 3 mm pellets); (2) an agitated powder bed; (3) a fluidized bed. The first method gave good results when using anhydrous FeCl_3 as an activator. The second method allowed the low-

Study of vinyl ...

ering of the temperature from 460 to 420°C. The vinyl trichlorosilane yield was 33% and the output 10 - 15 g/hour/kg of catalyst. The third method resulted in a reduction of the contact time by a factor of 12 and a corresponding considerable increase in temperature. The yield of vinyl trichlorosilane was reduced, as the side reactions were enhanced, to ~26%. In contrast to the synthesis of methyl, ethyl and phenyl chlorosilanes where the best results are obtained in the fluidized bed, this method does not provide the contact times necessary for synthesis of vinyl chlorosilanes. As an alternative to the above reaction, the reaction $\text{HSiCl}_3 + \text{CH}_2 = \text{CHSiCl}_3 + \text{HCl}$ is proposed. This reaction was investigated, yields of 65% being obtained at 500°C with a contact time of 35 seconds. In the synthesis of methyl vinyl dichlorosilane by the reaction $\text{CH}_3\text{SiHCl}_2 + \text{CH}_2 = \text{CHCl} \rightarrow \text{CH}_3(\text{CH}_2=\text{CH})\text{SiCl}_2 + \text{HCl}$, the optimum conditions ensuring a 55% yield were 540°C and a contact time of 30 seconds. Thus the condensation of hydrochlorosilanes with vinyl

TITLE: Thermal condensation of trichloro silane and methyl dichloro silane with vinyl chloride

PERIODICAL: Plasticheskiye massy, no. 10, 1962, 21 - 27

TEXT: Thermal condensation of vinyl chloride with methyl dichloro silane into methyl vinyl dichloro silane (I), and vinyl chloride with trichloro silane into vinyl trichloro silane (II) was conducted in a reaction tube of stainless steel under atmospheric pressure and at 30 sec contact time. Optimum reaction conditions were determined, and the condensation mechanism and thermal decomposition were studied. Results: The optimum temperature for synthesizing (I) is 530 - 540°C, the yield is 75 - 80% as referred to the reacting methyl dichloro silane. The side products are methyl trichloro silane, butadiene, high-boiling products, and gases containing 2% H₂, 5% C₂H₄, 4% C₂H₃Cl, 2% CH₄, and up to 1% C₂H₅. The thermal decomposition of

Card 1/3

Thermal condensation ...

methyl dichloro silane starts in at 400°C and reaches 20% at 570°C. The gaseous decomposition products contain 75% H₂ and 25% CH₄. The solid residue contains 65% Si but no free carbon. A radical mechanism is assumed, as the solid decomposition products catalyze the decomposition of methyl dichloro silane. The optimum conditions for the synthesis of II are: a molar ratio HSiCl₃ : C₂H₃Cl = 1 : 1.5 and 500 - 520°C. The yield is 70 - 75% as referred to the reacting HSiCl₃, and 60% referred to the reacting vinyl chloride. If the ratio is reduced to 1 : 0.6, the temperature has to be raised to 560 - 580°C. A ratio of 1 : 1 yielded 80% II with respect to HSiCl₃. The side products are equal amounts of SiCl₄ (15 g-moles per 100 g-moles HSiCl₃) and high-boiling polymers. The gas contains 5% H₂, 12% C₂H₄, 3% C₂H₆, the solid residue contains 10 - 50% Si and 30 - 75% elementary carbon. The thermal decomposition of HSiCl₃ in H₂, SiCl₄, and Si sets in at 560 - 570°C. The effect of the reaction vessel wall on the composition of the reaction products confirms the radical mechanism of the reaction. A surface increase of the reaction vessel by Raschig rings,

TITLE: Instrument for Determining the Liquid-vapour Equilibrium
at Elevated Pressures

PERIODICAL: Chemické listy, 1959, Vol 53, Nr 1, pp 22 - 25

ABSTRACT: A static apparatus for measuring liquid-vapour equilibria at high pressures has been designed. The disturbance of the equilibrium conditions devising the sampling operation, which occurs in the usual type of bomb apparatus, is eliminated by subdividing the apparatus into two or three chambers which can be isolated by closing a double stop valve fitted on a single spindle, which prevents non-equilibrium evaporation. A sketch (line drawing) of the apparatus is shown in Figure 1. Acknowledgments are expressed to J. Šuba for assisting in the design of the instrument. There are 1 figure and 2 references, of which 1 is Czech and 1 English.

TITLE: Gas laser for visible and infrared regions

SOURCE: Jemna mechanika a optika, no. 9, 1964, 269-275, 282

TOPIC TAGS: helium neon, silicon tube, discharge tube, CW gas laser

ABSTRACT: The article describes the design, characteristics and application of two CW He-Ne gas lasers emitting at wavelength of 1.1522, 3.3, and 0.6328 μ , built in Czechoslovakia. The authors claim their superior performance in comparison with other laboratory use. The article also includes a review of gas lasers. The gas discharging tubes and the Brewster's windows in these lasers are made of silicon of high optical purity. The technological processes of their construction, including material used, are also given in detail. This work was performed at UPT with the cooperation of R. Chudoba, J. Fajt,

AUTHOR: Popalyash, Ye. N. (Candidate of technical sciences)

TITLE: Application of the ARS-1 automatic recording system to statistical process analysis.

SOURCE: Priborostroyeniye, no. 3, 1965, 13-17

TOPIC TAGS: statistical analysis, random process analysis, automatic recording system, computer input, encoder

160

ABSTRACT: The basic technical features of the ARS-1 automatic recording system are described from the point of view of data processing and recording of random processes for subsequent statistical analysis by a Ural-2 computer. The two main parts of the system are the measuring part and the information-processing part. The measuring part accommodates 12 input channels from conventional sensors and records each channel separately on magnetic tape, using frequency modulation. The information stored on tape can be made available in the form of an oscilloscope display, a graph on paper tape, or a binary code on another magnetic tape suitable

Card 1/3

L 42122-65
ACCESSION NR: AP5007785

for immediate computer processing. The information-processing part also has provisions for correction of sensor nonlinearities. The graph is recorded by a ferrographic process using a 300-mm-wide magnetic tape moving past a column of 256 recording heads spaced 1 mm apart at a velocity of 100 mm/sec. The ferrite powder which is deposited on the tape after magnetization is then transferred to paper. Two graphs, each 128 mm wide, can be recorded simultaneously. Uniform quantization with 256 levels of 0.2 volts each is used in the system. The sampling frequency of the encoder can be adjusted between 30 and 1200 cps. The coded information from each channel is stored on magnetic tape in the form of parallel nine-bit code groups. A special converter, which is not part of the ARS-1, was designed to feed the coded information from the tape into the Ural-2 computer with speeds of up to 2000 code groups per second. The average speed of the Ural-2 is 5000 operations per second and the capacity of its working storage is 409 twenty-bit numbers. Using the 9-bit code of the ARS-1, the computer can store a maximum of 8192 numbers, a portion of which must be reserved for the statistical analysis program. Other pertinent characteristics given are: input voltage range 0-6 volts; bandwidth, 0-30 cps; continuous operating time, 15 minutes; overall accuracy, 3%. An example of a computed autocorrelation function of a 12-second

Card 2/3

I 42122-65

ACCESSION NR: AP5007785

process sample function is given. The autocorrelation function is plotted from 70 computed points with each point requiring about 7 seconds of machine time. "Engineers K. A. Kudryashov and V. Ye. Litvinenko took part in the development of the input device." Orig. art. has: 6 figures and 2 formulas. [08]

Ed.; A. S. Savchenko, Engineer.

PURPOSE: This book is intended for engineers and technicians working in the planning and design of devices and control systems and can also be used by students in the electrotechnical departments of schools or higher technical

institutions. The book contains articles containing results achieved by the Department of Electromechanical Devices and Automatic Equipment of the Moscow Aviation Institute. Some contributions in the development of hermetical devices and automatic equipment. The book covers the following: design of a transformer for an extremal regulator and eliminating extreme tension problems of the dynamics of linear and nonlinear control systems; modelling, members of which, and the design of devices for measuring physical quantities, and the revolutions of engines. No personalities are mentioned. References are found at the end of some articles.

PERIODICAL: Svarochnoye proizvodstvo, 1960, No. 8, pp. 40-41

TEXT: The Fifth Annual Regional Conference on the results of scientific and industrial work achieved in the field of welding during 1959, was held in Moscow from March 22-24, 1960. The Conference was attended by over 600 representatives of various organizations from Moscow, the Moskovskaya Oblast', Leningrad, Bryansk, Vladivostok, Dnepropetrovsk, Kramatorsk Ufa, Voronezh and other towns. The Conference was opened by N.N. Rykalin, Corresponding Member of the AS USSR, Head of the Welding Department at MONITOMASH. The Conference heard the following reports: Engineer Ye.V. Deyev, representatives of Gosplan RSFSR, on the supply of welding equipment and materials in 1960 and the following years; Ye.M. Rogova, Engineer, VNIIST, on "New Electrodes With Plastic Moisture Resistant Coating for Welding Low-Carbon and Low-Alloy Steels"; A.G. Mazel', Candidate of Technical Sciences, VNIIST, on "Investigation of the Metal Transition in the Welding Arc During Manual Arc Welding"; V.A. Vinokurov, Candidate of Technical Sciences, and

TITLE: Results of an investigation on the reliability of type D2 germanium point diodes

SOURCE: Akademiya nauk Latviyskoy SSR. Institut elektroniki i vychislitel'noy tekhniki. Avtomatika i vychislitel'naya tekhnika, no. 11, 1965, 231-238

TOPIC TAGS: germanium diode, reliability engineering, temperature dependence, time measurement, component life expectancy

ABSTRACT: The static parameters of semiconducting germanium point diodes (type D2) for temperatures ranging from 20 to 70°C for periods up to 7000 hrs are presented. Experiments were carried out on 400 diodes produced in 1962 and on 400 diodes produced in 1959. Both the direct and reverse currents were related to temperature by $I_{dir} = Ae^{a(T-T_0)}$. From the data

$$I_{dir} = 8.5e^{0.0079(T-20^\circ)} \text{ and } I_{rev} = 176e^{0.0022(T-20^\circ)}$$

for the 1959 diodes, while

$$I_{dir} = 6.67e^{0.0077(T-20^\circ)} \text{ and } I_{rev} = 30.9e^{0.039(T-20^\circ)}$$

for the 1962 diodes. The ratio $I_{rev\ (70C)} / I_{rev\ (20C)}$ was 2.4 for 1959 and 7.5 for 1962. The values for the direct currents were 1.1 to 1.3 times greater for the 1959 diodes. The time dependence for I_{dir} and I_{rev} was plotted for both sets of diodes at 30, 50, 60 and 70°C and represented by the following equations:

$$I_{dir\ ar} = t_{gat\ test} + I_{dir\ ar}^0$$

and

$$I_{rev\ ar} = t_{gat\ test} + I_{rev\ ar}^0$$

where $I_{dir\ ar}$ and $I_{rev\ ar}$ are the average values of the direct and reverse currents at any time during the test; $I_{dir\ ar}^0$ and $I_{rev\ ar}^0$ are average values of the direct and reverse currents at $t=0$; t is time. The average useful lifetimes are presented for the above temperatures as a function of I_{dir} and I_{rev} . The 1962 diodes were found to be generally superior to the 1959 diodes. Orig. art. has: 10 figures, 2 tables, 7 formulas.

The mechanism of bacterial intoxication. IV. Influence of histamine upon the adrenaline content of the suprarenal glands and blood in bacterial infection and intoxication. Z. A. Popenenkova (N. F. Gamalei Inst. Epidemiol. and Microbiology Med. Sci. U.S.S.R., Moscow). By E. S. Eksptl. Biol. i Med. 33, No. 8, 53-60 (1964).--Rabbit injected with an 18-hr. culture of type I pneumococcus died 4-5 days later. The blood level of adrenaline was determined by the method of Whitehorn and Shaw before the injection and daily after injection until death. The adrenaline level remained normal during the first 3 days and increased 2-2.5 times a short time before death. The adrenaline content of the adrenal glands decreased. Since introduction of an antihistamine substance prevented a decrease of the adrenaline content of the adrenal glands, it was assumed that the decrease which took place during the life of infected animals was due to formation of histamine-like compds. This was confirmed to a large extent by injecting 10 rabbits with histamine. The majority showed a considerable decrease of adrenaline, but the results were not uniform. A. Mukin

✓Changes in nucleic acid content of intestinal rods with acquired resistance to grisein, Z. A. Popenekova, Zhur. Mikrobiol., Epidemiol. i Immunobiol. 1956, No. 1, 26-32.— Intestinal rods which were resistant to grisein contained less nucleic acids than parent cells during the lag phase and in the beginning of the logarithmic growth phase. Grisein-resistant strain showed the same rate of ribonucleic acid formation, during growth, as the sensitive strain; the resistant strain showed a tendency to accumulate deoxyribonucleic acid. J. A. Stekol

*The influence of cortisone upon an experimentally induced pneumococcal infection (Russian text) BJULL.
EKSPER.BIOL.MED. 1956, 41/3 (35-38)

The experiments were carried out on 26 rabbits: 9 rabbits were infected with pneumococci and left untreated, 6 rabbits were infected with pneumococci and treated with cortisone, 5 rabbits had cortisone only and 6 normal rabbits served as controls. Treatment with cortisone hindered the development of the local inflammatory reaction in rabbits infected with pneumococci and increased the severity of the infection. The treated rabbits died on the 2nd day, following the infection; the untreated animals, infected with the same dose of pneumococci, died on the 5th-6th day. At the same time cortisone effected a decrease of ascorbic acid in the adrenals, leaving the content of adrenaline unchanged.
